TITLE : DISPLAY METHOD FOR
INFORMATION AND INFORMATION
DISPLAY DEVICE

ABSTRACT : PROBLEM TO BE SOLVED: To use the device like a book is actually read by displaying information in a frame as if part corresponding to the end, top, or bottom of the book were seen obliquely and making the width of the display correspond to the number of pages.

SOLUTION: A display device 1 is constituted by storing a circuit block in a housing in a thin-plate shape and stacking a liquid crystal panel 2 and a touch panel 3 on the top surface of the housing. A central processing unit displays the frame W so that left and right pages are seen overlapping with each other like the book is stereoscopically viewed obliquely from the front. Further, the numbers of pages before and after a page which is currently displayed are detected and the frame W is displayed to the thicknesses DR and DL of pages overlapping with the right and left pages. Consequently, the place of the page which is currently displayed can visually be grasped as if the book were actually opened and then the usability is therefore improved.
